Software Defined Networking

Dr. Nick Feamster
Associate Professor

In this course, you will learn about software defined networking and how it is changing the way communications networks are managed, maintained, and secured.

This Lesson: Slicing Network Control

- Overview of "network slicing"
  - What is slicing?
  - Why slice the network?
  - Flowspace and slicing policies
- FlowVisor: Virtualizing SDN Control
- Applications

Current Network Devices

Control
Plane

- Computes forwarding rules
  - "128.8.128/16 --> port 6"
- Pushes rules down to data plane

Rules

Control/Data
Protocol

Excepts

Data
Plane

- Enforces forwarding rules
- Exceptions pushed back to control plane

Add a Slicing Layer Between Planes

- each slice believes it owns the data path
- enforces isolation between slices

Slice 1 Control Plane

Slice 2 Control Plane

Slicing Layer

Slice Policies

Rules

Control/Data Protocol

Excepts

Data Plane

Network Slicing

- ◉ Divide the production network into logical slices
  - ◉ each slice controls its own packet forwarding
  - ◉ users pick which slice controls their traffic
  - ◉ existing production services run in own slice

- ◉ Enforce strong isolation between slices
  - ◉ actions in one slice do not affect another

- ◉ Each slice can mirror a production network
 - ◉ Production
  - ◉ Testing
  - ◉ Research

Why Slice the Network?

- ◉ Multiple administrative groups
  - Different departments on a campus
- ◉ Multiple customers
  - Tenants in a shared data center
  - Researchers on a shared infrastructure
- ◉ Experiments vs. operational network
  - Support research without breaking real services
- ◉ Expanding a network's footprint
  - Lease components in another carrier's network
- ◉ Multiple services or applications in one domain

Slicing: Forwarding and Policy

- Data plane unmodified (no performance penalty)

- Policy: Specifies resource limits for each slice
  - Link bandwidth
  - Maximum number of forwarding rules
 - Topology
  - Fraction of switch/router CPU

Flow Space:
Which Packets Does the Slice Control?
One Example: FlowVisor

- **FlowVisor:** An OpenFlow controller that acts as a **transparent proxy** between OpenFlow switches and multiple OpenFlow controllers.
  - **Slices:** any combination of switch ports (layer 1), src/dst ethernet address or type (layer 2), src/dst IP address or type (layer 3), and src/dst TCP/UDP port or ICMP code/type (layer 4).

- Enforces isolation between each slice.
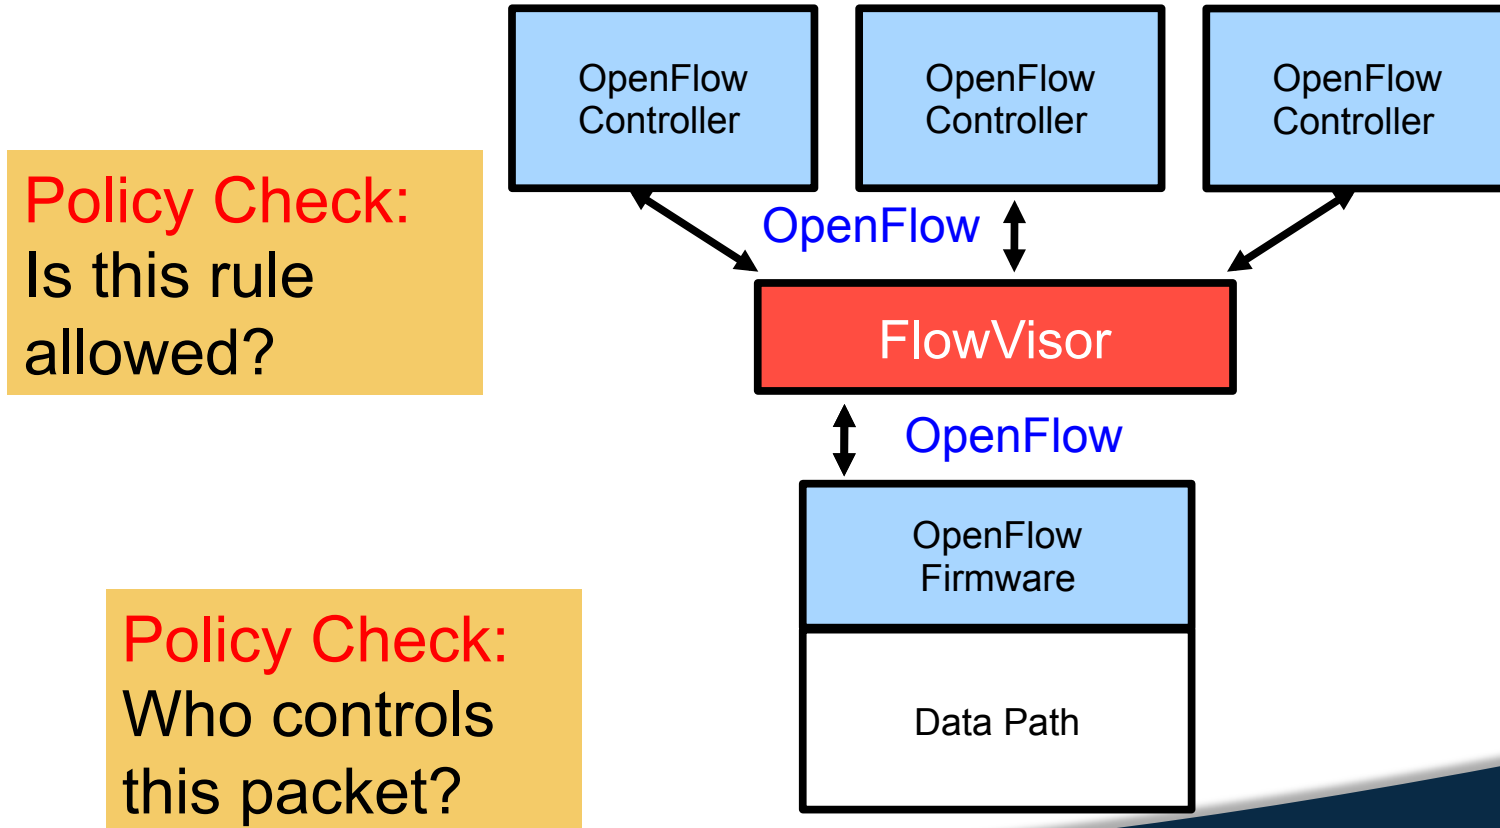

Examples: Ways to Slice the Network

- ◉ By switch port
  - Basically the same functionality as VLANs
- ◉ By application (TCP port)
  - Would require some more complicated access control lists
  - Dynamism possibly a bit more difficult without SDN

Application: Testing

- Connect fully operational networks that "mirror" the existing production topology

- More realistic evaluation and testing

- Same control software can be "migrated" to production

Application: Home Networks / IoT
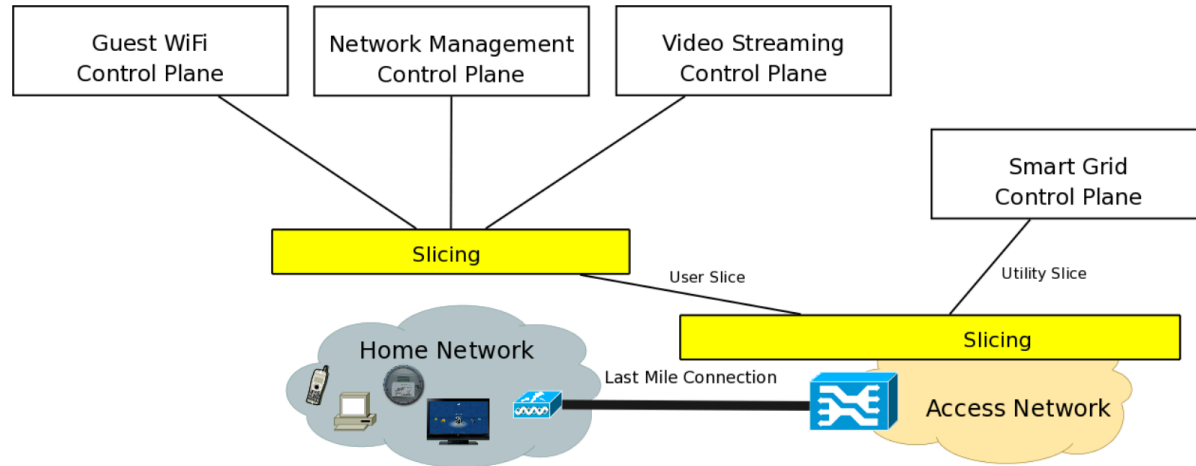

- ⊙ Multiple service providers on a sliced home network
- ⊙ Access network owner gives a slice of the last mile to the user, rents another one to utility company, etc.

13

Summary

- Slicing the SDN control plane allows for
  - Multiple administrative entities
  - Pre-production testing (operations or research)
  - Sharing between multiple tenants
- Slicing can be done by switch port, or any part of "flow space"
- FlowVisor is one example of slicing SDN control
